

## AnalysisXpress by using SolidWorks 2014

Analysis Xpress is the combination of tools available in SolidWorks to perform some very useful analyses at a very high pace. There are various types of analyses available in SolidWorks like; SimulationXpress Analysis, FlowXpress Analysis and so on. These analyses are performed for the following functions:

**SimulationXpress Analysis:** This analysis is used to check whether the component will fail on the specified force/pressure conditions or not. You can generate a report and perform the optimization.

**FloXpress Analysis:** This analysis is used to check the flow of a fluid through the designed passage.

**DFMXpress Analysis:** This analysis is used to check whether the created component is manufacturable or not.

**SustainabilityXpress:** This analysis is used to check the impact of environment on the component.

**Part Reviewer:** This analysis is used to check how the part was created in SolidWorks. Sometimes this analysis becomes very useful to find error in modeling in SolidWorks. In this chapter, we have covered SimulationXpress, FloXpress, and DFMXpress Analysis.
